

Duplicate Pages

Description

This is an app that duplicates pages in a one-page PDF-file. If you want the PDF to have three pages of the same as the original file, this app can help you with that.

This can be useful when doing automated impositions of for example, like business cards. In that case the customer usually wants different amounts of cards. If they then provide you with an Excel file (or other data formats) one of the columns in the Excel sheet can have a multiple of the number of cards for the different persons. This value can be entered as a variable in this app and each file of business cards will have a multiple of pages of the number of cards to print.

When the imposition is made you get a sheet where some cards are placed three times, other two times and some just once and so on.

The app only allows one-page PDF-files to be processed, if it has more than one page it ends up in the error connection. Non PDF-files ends up in the Problem jobs folder.

Compatibility

Switch 13 update 1 and higher. Windows or Mac OSX.

Compatibility third-party applications

This app uses PDF Toolkit to process the files; due to licensing it is not allowed to embed this software in to the app. You have to install PDF Toolkit on your system for this app to work. Note that it is the server version you need!

You can download installers here:

<https://www.pdfabs.com/tools/pdftk-server/>

When installing PDFtk-server on Windows, use the default settings for the installer, if you choose another directory for the installation than the default this app might not find the PDFtk-server application by itself. You then have to use the setting for the app "Set path to application" by right-clicking the app icon in the Flow elements section.

Connections

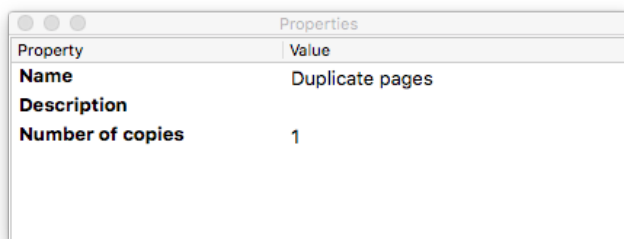

Duplicate Pages can have several input connections. Outgoing connections are of the traffic light type, if the incoming file has more than one page it will be sent to the error connection.

Properties detailed info

There is only one property in this app, the number of copies you want to make of your PDF. Default setting is 1. Set the property value to the number of copies you want. The property settings can also use variables.

Flow element properties

- Number of copies, set the number of copies you want of the page in the PDF-file.

| Property | Value |
|-------------------------|-----------------|
| Name | Duplicate pages |
| Description | |
| Number of copies | 1 |
