

## PDFPrinter

version 3

### Description

PDFPrinter allows a Switch flow to directly send a PDF file to any local or network that has been installed on the Switch server.

### Compatibility

Switch 13 update 1 and later  
Windows operating system only

### Setup

The PDFPrinter requires a driver to be installed before it can function correctly. The App will attempt to install the driver but may fail if it doesn't have sufficient permissions. An error will be displayed in the log messages. If this occurs, please download the installer from <https://goo.gl/rWC5Y3> and install both the 32- and 64-bit drivers.

### Connections

The PDFPrinter app requires at least one input connection. It only accepts jobs that are a single PDF file. No job folders or other file formats are supported. Convert other formats to PDF prior to attempting to print using PDFPrinter app.

An output connection is optional. If there is not an output connection then the job will be deleted after printing.
