# GSApi Order Submit for MultiPress

Description
GSApi is a cloud based order automation solution for MultiPress. GSApi Order Submit enables you to submit XML or jSON orders to GSApi, with only a username and a password.

After you've submitted the order to GSApi, GSApi will then convert and push the order to MultiPress. The MultiPress server is configured in the secured GSApi frontend.

Compatibility
Switch 17 Update 2 or higher

For MacOS & Windows compatibility see Enfocus Switch System Requirements (link: https://www.enfocus.com/en/support/system-requirements/switch-system-requirements)

Connections
GSApi Order Submit can have multiple input connections, but only has two output connections: one success out and one error out. When an order is successfully submitted to GSApi, the XML/jSON file will be placed in the success out folder. When there is an error, it will be placed in the error out folder.

Flow elements properties

- **Environment**
    - Switch between demo or live environment. Demo environment can only be used when an account on https://demo.gsapi.nl is present and active.

- **Username**
    - The API username for the customer you are submitting the orders.

- **Password**
    - The API password for the customer you are submitting the orders.

- **Retry interval in seconds**
    - When there is a problem with your internet connection for example, GSApi Order Submit app will put the orders on hold and retry after x seconds.

- **Job expire time in minutes**
    - When there is no internet connection for a longer period of time, GSApi wil expire the job after x minutes.

Outgoing connections properties

- Success out
- Error out

Changelog

29-10-2019 – V2
- Changed from NoSSL to SSL connections
- Added the ability to switch from live to demo environment
