

Fiery Prep-it Submit

Description

This app offers all job setup options that are available in Fiery® Prep-it™. But instead of using static job setups which are attached to hot folders, the Switch user can now dynamically assign individual job and job processing settings to each PDF file, and transfer both the production PDF file, and the JSON job control file to a Fiery Prep-it hot folder.

Compatibility

Switch 2022 Fall and later.

Compatibility third-party applications

Fiery Prep-it v6.3.1 and later.

Application discovery details

Access to a Fiery Prep-it hot folder is enabled via a “select folder path” property editor.

Connections

The app supports a single incoming/outgoing connection. Job-specific metadata gets attached to the incoming file sent to the Submit app as an XML or JSON dataset.

Processed jobs — with incoming file untouched — get a JSON-based dataset attached (default name is **automation**) which contains all Fiery Prep-it job settings derived from the current Submit app setup. This metadata can be also used for archiving or job property reporting as examples.

The expected incoming job format for Fiery Prep-it is typically a PDF file, however TIFF, JPEG, BMP, PNG file types are also supported.

Flow elements properties

- **Prep-it server base dir**
Folder path of Fiery Prep-it Server's base directory
- **Prep-it hot folder**
Folder path of one of Fiery Prep-it Server's hot folders
- **Import mode**
One of Fiery Prep-it Server's import modes

For all other properties, please consult the Fiery Prep-it User Guide.
